Aside from Data Definition Language, there a number of types of requests you make to a MySQL database. These include Data Manipulation Language, Data Query Language, Data Control Language, and Transaction Control Language. When retrieving data from a MySQL database, the SELECT query is usually used (Data Query Language). The WHERE clause is often used to filter the data returned.

SELECT * FROM names WHERE name='Bob';

There were a lot of things covered this week that I enjoyed learning. It was helpful being able to visualize tables and their relationships with entity relationship diagrams. I also really liked learning about MySQL commands and building tables. But it was also beneficial to explore MySQL Workbench and DBeaver to set up and connect to a database.
